

MULTIPLE ACTIVITIES AND INTENTS

TOPICS

- Multiple Activities
- Intents Explicit
- Intents Implicit
- Pass data between Activities
- Starting an Activity for result

-
- An Intent is a messaging object you can use to request an action from another app component(Activity).

- The fundamental use-cases for Intent are:

- 1. To start an activity:**

- 2. To start a service:** component that performs operations in the background without a user interface

- 3. To deliver a broadcast:** system boots up or the device starts charging.

TYPE OF INTENTS

- Intents are objects of the `android.content.Intent`
- We can add data to the intent (using `Bundle`).
- android provide two type of Intents
- **Explicit intents** : specify the component to start by name
- **Implicit intents** : do not name a specific component, but instead declare a general action to perform

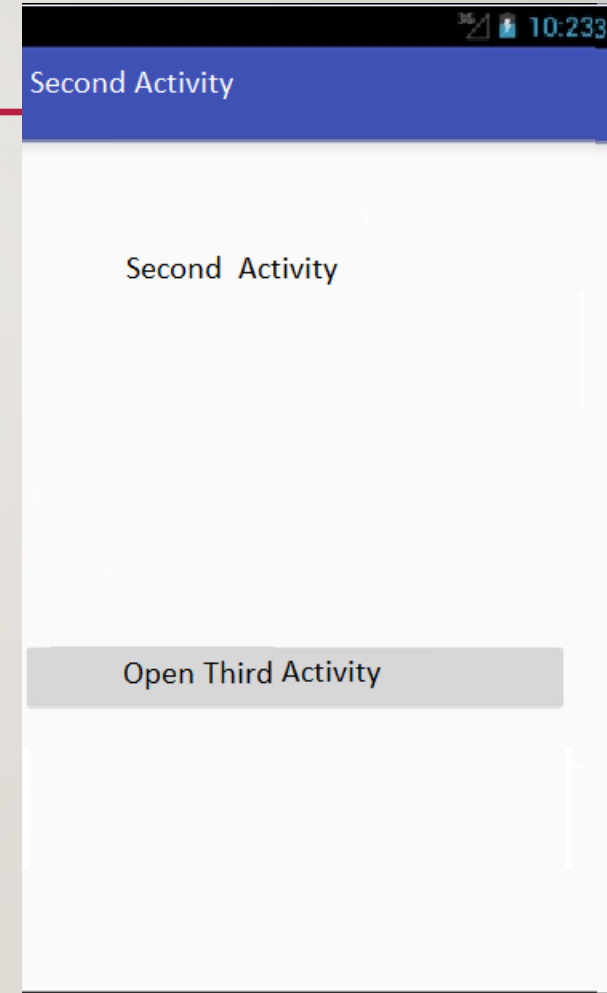

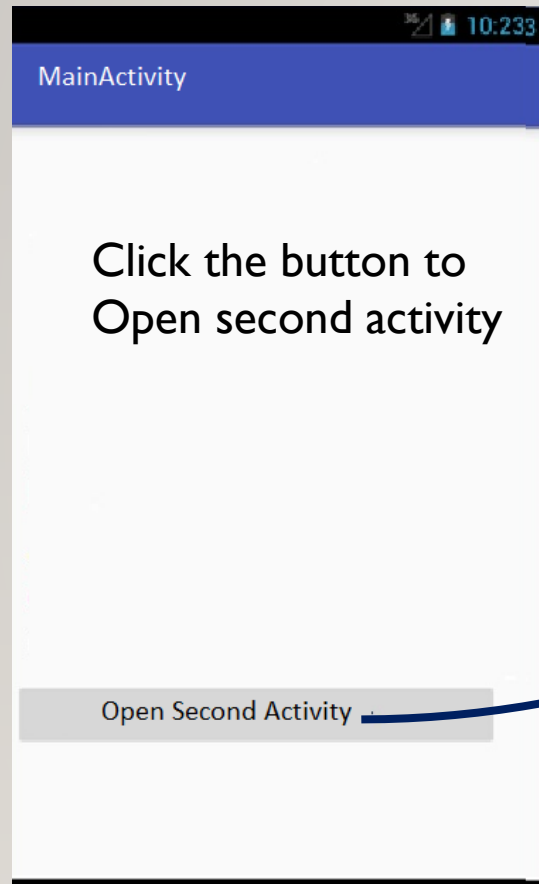

EXPLICIT INTENTS

to Start activity or service

To start an activity or Service use the methods

- `startActivity/startActivityForResult` – to launch an Activity
- `startService*` – to start a background service

EXAMPLE

EXAMPLE EXPLICIT INTENTS

```
public void goToActivity2 (View view) { //  
Intent intent = new Intent (this, SecondActivity.class);  
startActivity (intent);  
}
```

PASSING DATA BETWEEN ACTIVITIES

Embedding data with an intent using putExtra method as shown below

```
public void start(View view) {  
  
    Intent i = new Intent( packageContext: this, SecondActivity.class);  
    i.putExtra( name: "name", value: "Tim");  
    i.put  
    }  
  
er 2 0  
ical 1  
er 2 0  
22d45
```

- putExtra(String name, int value) Intent
- putExtra(String name, byte value) Intent
- putExtra(String name, char value) Intent
- putExtra(String name, long value) Intent
- putExtra(String name, float valu... Intent
- putExtra(String name, int[] valu... Intent
- putExtra(String name, short valu... Intent
- putExtra(String name, Bundle val... Intent
- putExtra(String name, byte[] val... Intent
- putExtra(String name, char[] val... Intent

EXTRACTING DATA FROM THE LAUNCHING INTENT

- If we can extract data from the intent that was used to launch our activity by

```
// 1- get the reference to the intent (that was used in StartActivity...)
```

```
// e.g. this can be done in on Create method
```

```
Intent intent = getIntent();
```

```
// 2- get the data from intent
```

```
if (intent != null) {
```

```
    // will be null if name not set in intent
```

```
    String name = intent.getStringExtra("name");
```

```
}
```

EXAMPLE PASSING DATA BETWEEN ACTIVITIES

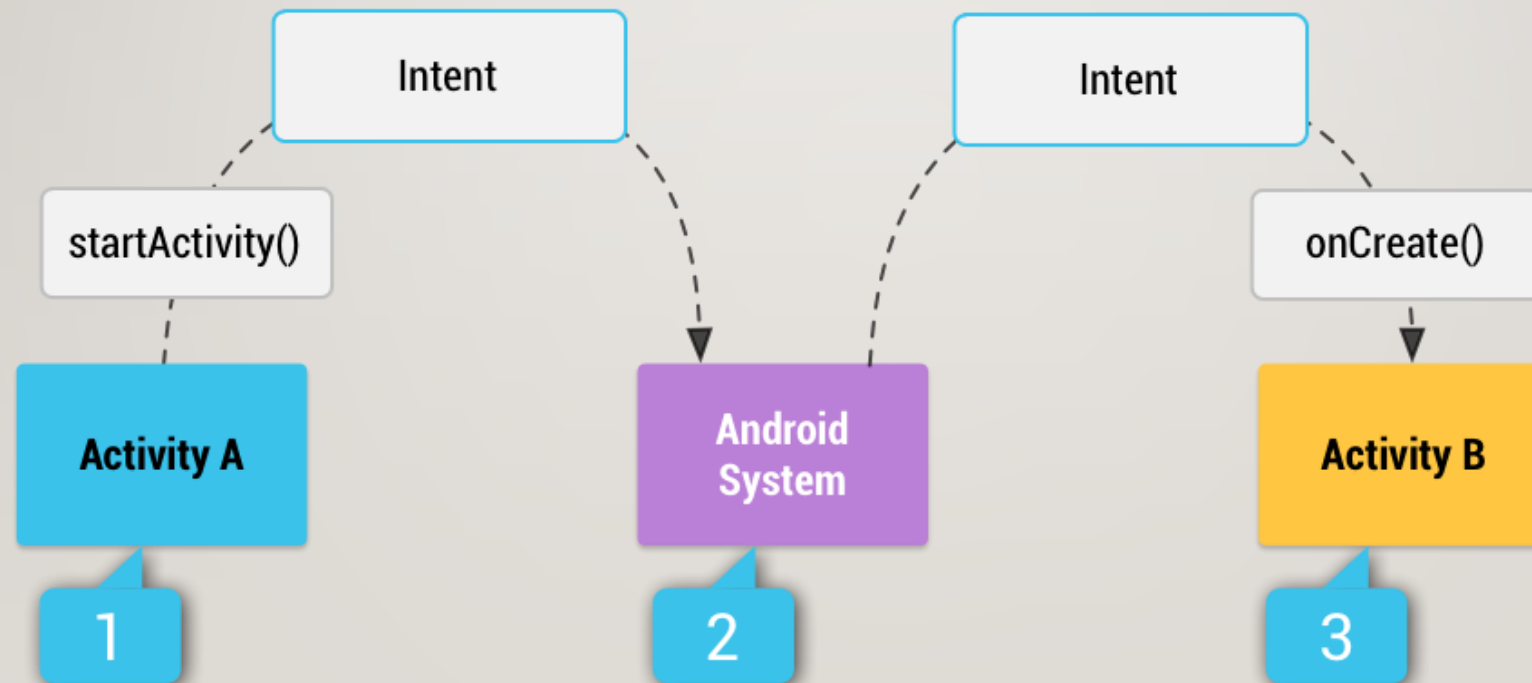

STARTACTIVITYFORRESULT

- Launch an activity for which you would like a result when it finished
- When this activity exits, your `onActivityResult()` method will be called with the given `requestCode`.
- Using a negative `requestCode` is the same as calling `startActivity(Intent)` (the activity is not launched as a sub-activity).

IMPLICIT INTENT

- the Android system finds the appropriate component to start by comparing the contents of the intent to the *intent filters* declared in the manifest file
- **String url = "http://www.google.com";**
- **Intent i = new Intent(Intent.ACTION_VIEW);**
- **i.setData(Uri.parse(url));**
- **startActivity(i);**

Intent primary information

- **Component name** The name of the component to start
- **Action** A string that specifies the generic action to perform

`ACTION_VIEW`

`ACTION_SEND`

- **Data**

The URI (a Uri object) that references the data to be acted

-
- **category** Gives additional information about the action to execute. For example, CATEGORY_LAUNCHER
 - **type --** Specifies an explicit type (a MIME type)
 - **extras --** This is a Bundle of any additional information.

EXAMPLE I

- **String url = "http://www.google.com";**
- **Intent i = new Intent(Intent.ACTION_VIEW);**
- **i.setData(Uri.parse(url));**
- **startActivity(i);**

EXAMPLE 2

- `// Create the text message with a string`
- `Intent sendIntent = new Intent();`
- `sendIntent.setAction(Intent.ACTION_SEND);`
- `sendIntent.putExtra(Intent.EXTRA_TEXT, textMessage);`
- `sendIntent.setType("text/plain");`
- `// Verify that the intent will resolve to an activity`
- `if (sendIntent.resolveActivity(getPackageManager()) != null) {`
- `startActivity(sendIntent);`
